1 Speaker Turn Distribution

Gantt chart & bar chart · Speaking time per participant

The following charts reflect participants' speaking time and/or speaking turns, so how long or how often these spoke during the meeting.

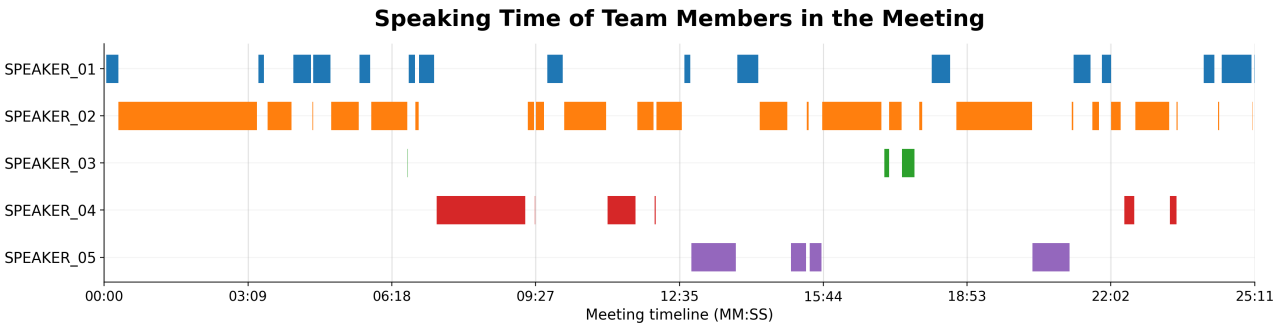

Figure 1a — Timeline showing when each speaker took the floor during the meeting.

The Gantt chart shows how participants' speaking turns are distributed across time, meaning that it gives information who spoke when and how long during the meeting. This can help you detect whether participants' contributions are evenly distributed across time and among each other, whether certain speakers dominate all or certain parts of the meeting, or which meeting phases are characterized by high or low activity.

In this particular meeting, speaking time was unevenly distributed across meeting participants for the first quarter, indicating that one speaker temporarily dominated this phase.

Speaking turns were unevenly distributed across time, with the fourth quarter showing the highest degree of interactivity.

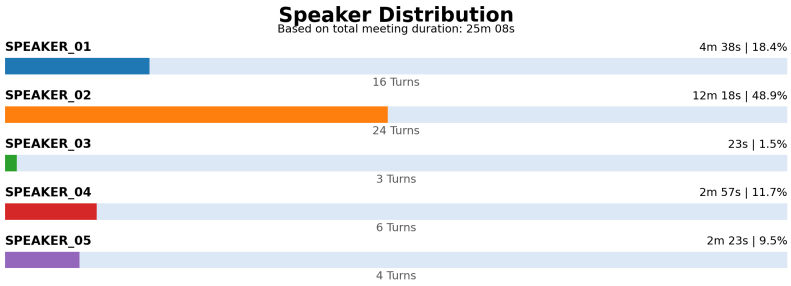

Figure 1b — Speaker distribution: total speaking time, share percentage and number of turns.

The bar chart shows the distribution of relative speaking time in the meeting (i.e., who spoke how much in comparison to the other speakers). This allows you to see how evenly speaking time was distributed across the entire meeting or whether some speakers spoke significantly more or less than others.

In this particular meeting, speaking turns were generally evenly distributed, with one or few less active participants.

2 Speaker Interaction Network

Network diagram · Turn-taking transitions

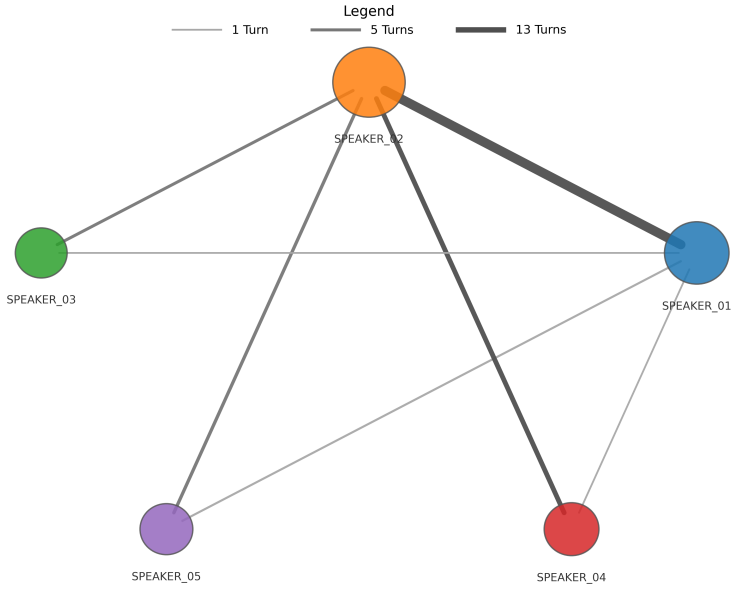

Figure 2 — Directed turn-taking network. Node size reflects total speaking turns; edge thickness reflects frequency of transitions between speakers. Node colours match the speaker colours used in Figure 1.

The network graph shows how speaking turns are distributed among speakers. The size of the circles indicates how many speaking turns a member has had in this meeting. The larger the circle, the more often this speaker has spoken. The lines connecting these circles indicate how often these speakers spoke directly before or after one another. The thicker the line, the more these two speakers interacted with one another. This allows you to see how much meeting communication was centered around specific speakers.

In this particular meeting, speaking turns were not centered around one or few specific speakers. Some members did not appear to interact with one another during the meeting.

3 Meeting Content by Function

Gantt chart & bar chart · Statement category over time

These two charts reflect the functional content of what participants said in the meeting. Meeting content is grouped into the following five functions: 1) task-oriented statements (everything that contributes to understanding and solving the task, e.g., problems, aims, solutions, or background information); 2) procedural statements (everything that structures the meeting, e.g., goal orientation, time management, clarifications); 3) socio-emotional statements (everything that contributes to interpersonal relationships, e.g., feedback, agreement, encouragement/praise, humor/jokes); 4) action-oriented statements (everything that helps advance work after/outside of the meeting, e.g., proactivity, task assignments, action plans); and 5) counterproductive statements (everything that harms productivity and relationships in the meeting, e.g., getting lost in unnecessary details, running each other down, lack of responsibility). While task-oriented statements are important, progress in meetings is also determined by whether contributions are structured (through procedural statements) and whether ideas are turned into actions (through action-oriented statements). Similarly, to create an atmosphere in

which everyone feels understood and comfortable to speak, it is important that team members regularly give each other constructive feedback and encouragement, or engage in humor to lighten the mood (socio-emotional statements).

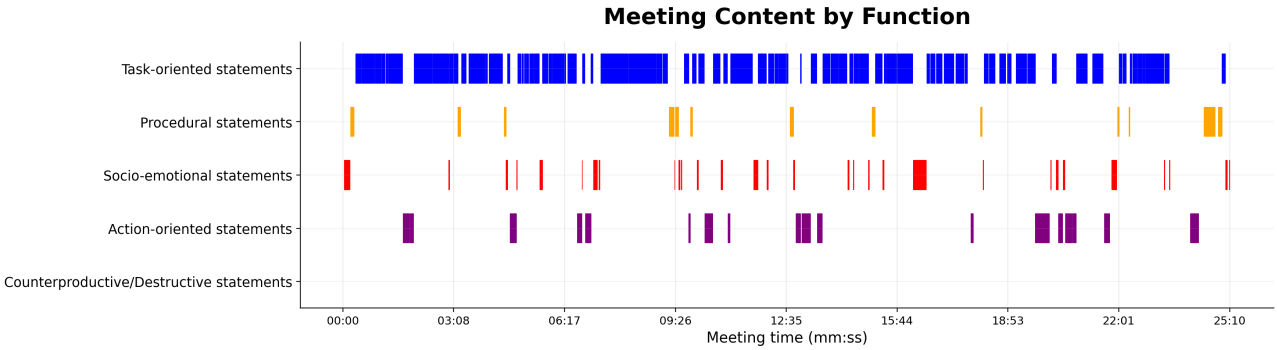

Figure 3a — Timeline showing when each statement type occurred during the meeting.

The Gantt chart shows how much speaking time is allocated to which meeting functions (e.g., task-oriented, socio-emotional) both across participants and across the course of the meeting. This enables you to see which speaker contributed to which meeting functions, when, and how often. Moreover, it enables you to see whether certain functions are followed by others and at which point in time.

In this particular meeting, task-oriented statements occurred mostly in the first, second, and third quarter(s) of the meeting.

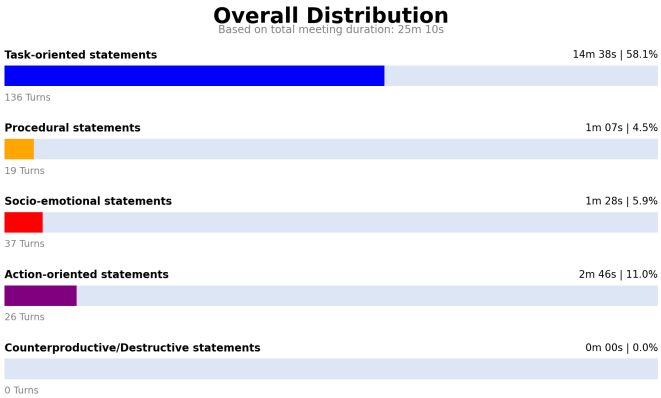

Figure 3b — Overall distribution of statement types: duration, share and number of turns.

The bar chart shows how much speaking time is allocated to the respective meeting functions across the entire meeting. This allows you to see if certain functions are over- or underrepresented in the meeting. Please note that all functions apart from counterproductive statements are considered as positive for meeting productivity and relationships. While meetings should aim for an adequate representation of all of these four positive functions, a slight unbalance is not necessarily negative but depends on meeting type, topic, and project phase.

In this particular meeting, task-oriented communication took up 58.1% of total meeting time, followed by action-oriented statements (11.0%). 0.0% of total meeting time was characterized by counterproductive statements.
